

Universal AI Master Prompt: Cyberpunk GitHub Profile

Self-Contained Instruction Set for Automated 100% Replication

Upload this document to Google Drive or copy the prompt into any AI agent (Antigravity, Claude, ChatGPT, Cursor, Gemini) to build this exact project for any developer.

1. How Any Person Can Use This Prompt

To generate an exact animated cyberpunk GitHub profile, any developer simply needs to **provide 3 inputs** along with the master prompt below:

Required Input	Description	Example / Notes
1. Resume / CV	PDF or text containing name, title, education, skills, contact & projects.	PDF upload or copy-paste text
2. Portrait Photo	Headshot or portrait image of the developer.	JPG / PNG image file
3. GitHub Username	Their GitHub handle (e.g. Shaik6184).	Used for repo name and live stats

2. The Complete Single Master Prompt (Copy & Paste)

Copy the entire prompt below and send it to the AI assistant:

[UNIVERSAL AI MASTER PROMPT: CYBERPUNK ANIMATED GITHUB PROFILE BUILDER]

SYSTEM ROLE:

You are an expert Principal Frontend Systems Engineer, SVG Graphics Architect, and Full-Stack Developer. Your goal is to build an interactive, production-ready, theme-adaptive **Cyberpunk Animated GitHub Profile README** tailored 100% to the user's uploaded resume, portrait photo, and GitHub handle.

INPUTS PROVIDED BY USER:

1. Resume (Extract: Full Name, Role Title, Tech Stack, Education, Contact, and Repositories).
2. Portrait Photo.
3. GitHub Username (<USERNAME>).

TECHNICAL ARCHITECTURE & DELIVERABLES TO IMPLEMENT:

1. **THEME-AWARE DUAL-IMAGE MORPHING HERO BANNER (dark.svg & light.svg):**
 - **Canvas Dimensions:** 1180x610 viewBox with 18px rounded macOS terminal frame, window controls (red, yellow, green), and animated glowing border (<linearGradient id="accent">).
 - **Left Visual Box ('VISUAL.MAP', 400x492):** Implement an automated 12-second seamless looping morphing transition between:
 - **Layer 1 (Real Photo):** User's portrait cropped and aligned to head/chest, embedded as base64 with clip-path.
 - **Layer 2 (Cyberpunk Dither Matrix):** High-precision Atkinson error-diffusion pointillism portrait with 25,000+ vector dots.
 - **Transition Sweep:** Animated holographic laser scanline (<line>) sweeping top-to-bottom at 5s-6.5s and returning at 10.5s-12s.
 - **Traveling Vector Particles:** 480 SMIL particle vectors (<use href="#tvdark"> / <use href="#tvlight">) looping continuously across facial contour coordinates.
 - **Right Terminal Bio ('SYSTEM.INFO'):** Render animated bio rows with staggered slide-in animations (<animateTransform>):
Subject, Role, Origin, Education, Status, ToolChain, Core.Lang, Core.Frontend, Core.Backend, Core.Database, Core.Infra, and Contact (Mail, Phone, LinkedIn, GitHub, Portfolio).
 - **GitHub Rendering Constraint:** All animations must use pure SVG SMIL (<animate>, <animateTransform>, <set>) with no external scripts so GitHub's sanitizer renders it natively.
2. **53-WEEK ANIMATED CONTRIBUTION SNAKE GAME (snake-dark.svg & snake-light.svg):**
 - Construct a full 53-week × 7-day contribution grid with dense, realistic commit activity across all months.
 - Apply theme palettes: Dark (#0A101F bg, indigo/purple/violet/cyan/emerald dots) and Light (#F8FAFC bg, cyan/purple/emerald dots).
 - Animate a 5-segment glowing snake actively patrolling and eating commits across the grid with a synchronized bottom progress bar.
3. **PROJECT SHOWCASE TERMINAL PANEL (projects.svg & projects-light.svg):**
 - Python generator (.github/scripts/generate_projects.py) rendering 6 curated repositories into card panels with custom badges, stars, and language byte percentages.
4. **GITHUB PROFILE README.md & ACTIONS WORKFLOWS:**
 - Assemble README.md with theme-aware <picture> elements, streak stats, top language split, snake game, project cards, and social badges.
 - Configure .github/workflows/projects.yml and snake.yml for automated daily cron updates.
 - Initialize Git, commit all assets, and push to main & output branches of github.com/<USERNAME>/<USERNAME>.

3. Core Algorithms & Math Reference

A. Atkinson Error-Diffusion Halftone Algorithm

Transforms any portrait photograph into crisp, high-contrast pointillism micro-dots with clean highlights and rich stippled shadows without muddy noise:

```
for y in range(height):
    for x in range(width):
        old_val = buffer[y, x]
        new_val = 255 if old_val > 120 else 0
        dithered[y, x] = 1 if new_val == 255 else 0
        err = (old_val - new_val) / 8.0
        buffer[y, x+1] += err; buffer[y, x+2] += err
        buffer[y+1, x-1] += err; buffer[y+1, x] += err; buffer[y+1, x+1] += err
        buffer[y+2, x] += err
```

B. Dual-Image Holographic Morph Timing Breakdown

- **0.0s – 5.0s:** Real Photo is 100% visible inside the frame.
- **5.0s – 6.5s:** Laser line sweeps from y=84 to y=576; photo fades out, Cyber Dither Matrix fades in.
- **6.5s – 10.5s:** Cyber Dither Matrix is 100% active with 480 traveling particle vectors.
- **10.5s – 12.0s:** Laser sweeps back up; dither matrix dissolves, smoothly restoring the Real Photo.

4. Quick Deployment Pipeline

Step	Terminal Command / Action
1. Create GitHub Repo	Create a public repository named exactly <USERNAME> on GitHub.
2. Generate SVGs	Execute Python generators to build dark.svg, light.svg, snake-dark.svg.
3. Push to GitHub	git remote add origin https://github.com/<USER>/<USER>.git && git push -u origin main --force
4. Set Permissions	In Repo Settings → Actions → General → Workflow permissions , select ' Read and write permissions '.

Cloud / Google Drive Ready: Upload this PDF to Google Drive or share it with any developer. Any AI assistant given this prompt can recreate this entire cyberpunk animated showcase from scratch.
