

Cyberpunk Animated GitHub Profile Generator

Master End-to-End System Prompt & Technical Blueprint

Self-contained prompt to replicate, customize, and deploy interactive animated SVG profiles on GitHub.

1. Executive Overview

This document contains the **complete single mega-prompt** and technical specification required to transform any developer's resume, portrait photo, and GitHub repositories into a top-tier **Cyberpunk Animated GitHub Profile README**. The architecture features SVG SMIL animations, pointillism dithering, 53-week contribution snake games, terminal project cards, and dark/light adaptive theming.

Component	Implementation Method	Tech Stack
Hero Banner	Dual-Image Morphing (Photo ↔ Dither)	SVG SMIL, Base64, Laser Sweep
Portrait Art	Atkinson Error-Diffusion Pointillism	Python PIL / NumPy / SciPy
Vector Particles	480 Continuous Traveling Coordinates	SVG <animateTransform>
Snake Game	53-Week Active Winding Game Simulator	SVG <animate>, Custom Palette
Project Cards	Automated Terminal Panel Generator	Python, GitHub REST API, Badges
CI/CD Automation	Daily Cron & Push Event Workflows	GitHub Actions, Secrets Token

2. The Complete Single Master Prompt (Copy & Paste)

Copy the entire prompt box below into any advanced AI coding agent (e.g. Antigravity / Gemini / Claude) to reproduce this entire project automatically:

[MASTER AI PROMPT: CYBERPUNK ANIMATED GITHUB PROFILE BUILDER]

Role: You are an expert Principal Frontend Engineer and SVG Graphics Specialist. Your task is to build a complete, production-ready, fully customized **Cyberpunk Animated GitHub Profile README** for a developer.

Inputs Provided:

- 1. User Resume PDF (Extract: Full Name, Title, Tech Stack, Education, Contact, Featured Projects).
- 2. User Portrait Image.
- 3. GitHub Username.

Architecture & Requirements:

1. Theme-Adaptive Hero Banner (dark.svg & light.svg):

- Construct an 1180x610 macOS terminal window frame with traffic lights (red, yellow, green) and gradient border.
- In the left 'VISUAL.MAP' box (400x492), implement a dual-image 12-second looping morphing transition between:
 - a) The user's aligned real portrait photo.
 - b) A high-precision Atkinson/Floyd-Steinberg dithered pointillism matrix with 25,000+ vector dots.
- Animate an interactive holographic laser scanline that sweeps vertically across during morph transitions.
- Overlay 480 looping SMIL vector particles (<use href="#tvdark">) traveling along facial feature paths.
- In the right 'SYSTEM.INFO' panel, render animated terminal bio rows (Subject, Role, Origin, Education, ToolChain, Core.Lang, Core.Frontend, Core.Backend, Core.Database, Core.Infra, and Contact) with staggered slide-in animations.
- IMPORTANT: Use pure SVG SMIL (<animate>, <animateTransform>, <set>) and self-contained base64 images so GitHub's sanitizer renders all animations perfectly.

2. Animated Contribution Snake Game (snake-dark.svg & snake-light.svg):

- Build a full 53-week x 7-day contribution grid with dense, realistic commit activity across all dates.
- Color code levels in cyberpunk palette: Indigo, Purple, Violet, Cyan, and Emerald.
- Animate a 5-segment glowing snake patrolling and eating commits across the entire year with bottom progress tracker.

3. Project Showcase Terminal Panel (projects.svg & projects-light.svg):

- Create a Python script (.github/scripts/generate_projects.py) that renders 6 curated repositories into sleek card panels with custom tech badges, star counts, and language bars.

4. GitHub Profile README.md & Actions Workflows:

- Assemble README.md with theme-aware <picture> elements, streak stats, top language bars, snake game, project cards, and social contact badges.
- Create .github/workflows/projects.yml and snake.yml for automatic daily cron updates.
- Deploy directly to the user's special repository (github.com/<USERNAME>/<USERNAME>) on main and output branches.

3. Technical Architecture Breakdown

A. Image Processing & Atkinson Pointillism Dithering Engine

To achieve the authentic terminal pointillism look from reference cyber art, the input photo undergoes background segmentation (isolating head and shoulders from outdoor foliage), followed by tone-curve contrast normalization and an **Atkinson Error-Diffusion Matrix**:

Atkinson Error Distribution Matrix:

- (x+1, y) += err × 1/8 • (x+2, y) += err × 1/8
- (x-1, y+1) += err × 1/8 • (x, y+1) += err × 1/8
- (x+1, y+1) += err × 1/8 • (x, y+2) += err × 1/8

B. Staggered SMIL Reveal & Looping Multi-Particle Trails

Active dither pixels are sorted into 32 distance-staggered groups that materialize between 0.20s and 3.20s with cubic-spline interpolation (<animate calcMode='spline' keySplines='.4 0 .2 1'/>). Over top, 480 micro particle vectors continuously glide across facial coordinate loops after 3.2s.

C. Dual-Image Holographic Morphing Mechanism

The hero banner seamlessly cycles between the Real Photo and the Cyberpunk Dither Matrix every 12 seconds:

- **0.0s – 5.0s:** Aligned Real Photo displayed inside VISUAL.MAP.
- **5.0s – 6.5s:** Holographic laser scanline sweeps down (y: 84 → 576), dissolving photo into dither matrix.
- **6.5s – 10.5s:** Cyber Matrix displayed with animated glowing particles and shifting gradient.
- **10.5s – 12.0s:** Laser sweeps back up, smoothly restoring the Real Photo in an infinite loop.

4. Quick Deployment Steps

Step 1: Create Repo	Create a public repository named exactly after your GitHub username: https://github.com/<USERNAME>/<USERNAME>.
Step 2: Generate SVGs	Run the Python SVG generation scripts to produce dark.svg, light.svg, snake-dark.svg, and projects.svg.
Step 3: Setup Workflows	Enable GitHub Actions with 'Read and write permissions' in Repo Settings → Actions → General .
Step 4: Push to Main	Execute git push -u origin main --force to publish your live profile instantly.

***Google Drive Instructions:** Upload this PDF file directly to Google Drive (e.g. into your Projects/Prompts folder). It contains the complete architecture, source logic, prompt, and deployment pipeline.*
